

 Strategic Partnership

STACKTIC & SUSE Rancher

The First Truly Managed Open-Source Platform

Speed of managed services. Openness of Kubernetes. Sovereignty by design.

70%+

COST
REDUCTION

80%

FASTER
DELIVERY

Zero

VENDOR LOCK-
IN

100%

SOVEREIGNTY

Together, Stacktic + SUSE Rancher compete head-to-head with managed hyperscaler platforms (**AWS, Azure, GCP**) — without sacrificing control, transparency, or freedom.

The Open Source Reality

Why the smartest companies run open-source Kubernetes

OpenAI, Netflix, Uber, Spotify — all run massive open-source Kubernetes.

Why? Because they **can**. They have the engineering talent and resources.

Enterprises and SMBs have the **strategy**, but not the **speed, skills, or someone willing to take responsibility** for the full open-source stack.

What "Managed" Really Means

- ✗ Old open source wrapped in proprietary APIs
- ✗ 30-50% markup for a convenience layer
- ✗ Yesterday's versions, permanently locked in
- ✗ No innovation — you get what the vendor allows

The Real Blocker

- ! Dependencies & versioning across services and foundations
- ! AI open source is skyrocketing, built for K8s, but extremely hard to manage
- ! No one owns the full-stack lifecycle — gaps everywhere
- ! Cross-component complexity grows exponentially with scale

Stacktic solves this.

E2E stable ecosystem automation and versioning of open source — making it **easier than managed** with auto-migration built in. Not only saving money and sovereignty — providing the **latest innovation and advanced capabilities** that only open source can deliver.

Clear Role Separation

No overlap, no duplication — clean responsibility boundaries

SUSE Rancher

Infrastructure & Kubernetes
Layer

- ✓ Multi-cluster Kubernetes management
- ✓ Cluster lifecycle & access control
- ✓ Curated app catalogs
- ✓ Enterprise Kubernetes foundation

OWNS THE INFRASTRUCTURE

Stacktic

Application & Stack
Sovereignty Layer

- ✓ Full-stack relationship automation
- ✓ Metadata-driven versioning & rollbacks
- ✓ Day-2+ ops, migrations, compliance
- ✓ Operational logic encoded as metadata

**OWNS THE STACK
SOVEREIGNTY**

Together: The First Truly Managed Open-Source Platform

Managed like AWS • **Open** like Kubernetes • **Sovereign** by design

0

Day 0: Architecture

Hours instead of
months

1

Day 1: Deployment

One-click to any
Kubernetes

2

Day 2: Operations

Automated ops,
security, rollback

The Joint Platform Stack

Rancher owns the infrastructure. Stacktic owns everything on top.

Stacktic understands and automates the **relationships between all components** — data flows, security, APIs, upgrades — making open source **stable, versioned, and production-ready**

What This Partnership Uniquely Enables

Four capabilities that only exist when Stacktic and Rancher work together

Visual Infrastructure Management for Rancher

Stacktic's drag & drop UI designs cluster infrastructure — networking, storage, GPUs, namespaces. Output pushes directly into Rancher, which provisions and manages the clusters.

Visual design → Rancher provisioning. No manual config.

Rancher App Catalog with Relationship Automation

Rancher App Catalog deploys individual apps. Stacktic's Relationship Engine generates the routing, data flows, security policies, and monitoring between them. Isolated catalog apps become a working stack.

Catalog deploys apps. Stacktic connects them into products.

Automated Migration to Kubernetes

Stacktic converts Docker Compose, VMs (VMDK/OVA), and managed cloud services into Kubernetes manifests with security and observability included. Rancher provides the target clusters (RKE2/K3s).

**Source: any legacy workload.
Target: Rancher-managed K8s.**

Private SaaS Platform Inside Rancher

Stacktic deploys inside Rancher as an on-prem platform. Stack design, automation, versioning, security, and Day-2 operations — all running on customer infrastructure. Zero external dependencies.

Full platform engineering. On-prem. Nothing leaves the network.

Unique Propositions — Doesn't Exist Today on AWS, OpenShift, or Any Platform

Automated SecOps & Compliance

Security policies, ops rules, compliance, and topologies generated automatically from stack metadata. Not manually configured.

Full Stack Version Control

Every component, config, and relationship versioned as one unit. Rollback the entire stack — not individual pieces.

Auto-Generated Docs & Audit

Dev documentation, audit reports, BOMs, and stack layer info generated from the actual stack. Always accurate, always current.

Deploy-Anywhere Stacks

Stacks are platform-agnostic. Same stack deploys to any cloud, on-prem, or edge — no vendor lock-in, no rewrite.

Multi-Stack Logic Automation

Centralized relationships across stacks — edge, enterprise, data. Real multi-stack orchestration, not isolated clusters.

One Platform for Everything

APIs, dependencies, data pipelines, SecOps, documentation, and infrastructure — managed in one place, not 10 tools.

Who This Is For

Two primary audiences with exceptional strategic fit

Regulated & Sovereign Orgs

Finance, Government,
Healthcare, Defense

- ✓ Air-gapped & disconnected environments
- ✓ Compliance-ready stacks
- ✓ Private AI / LLM infrastructure
- ✓ Complete data sovereignty

Benefit: Full control with enterprise-grade automation

Enterprises & Platform Teams

Scale-ups, Innovation Labs, App
Factories

- ✓ Standardized internal app factories
- ✓ Multi-tenant environments
- ✓ Reduced headcount dependency
- ✓ Ship production in hours, not months

Benefit: Ship faster at a fraction of the cost

Typical Entry Points

Cloud Exit

Migrate from managed services

Private AI

Sovereign LLM infrastructure

Modernization

Legacy to open-source K8s

Compliance

Regulated industry needs

The Platform Landscape

Three approaches — only one delivers speed, control, and sovereignty together

What Stacktic + Rancher uniquely delivers

- | | | | |
|---|---|---|---|
|  |  |  |  |
| Relationship Automation | Stack Version Control | Security by Design | Cloud Agnostic |
| Full stack logic, data flows, and dependencies | Rollbacks, migrations, and environments | 10-layer defense — all auto-generated | Portable stacks: on-prem, air-gapped, any cloud |

Enterprise Security & Control

Defense in depth — automated across the entire stack

1 Network Policies Zero-trust, pod-to-pod isolation, microsegmentation

2 RBAC & Access Control Multi-layer permissions, namespace isolation

3 OPA Gatekeeper Policy enforcement, admission control, governance

4 Secrets Management (SOPS) Auto-encryption, zero manual handling

5 API Gateway & Service Mesh mTLS, OAuth, rate limiting, traffic control

6 CVE & SBOM Scanning Vulnerability management, supply chain security

7 Audit & Compliance Auto-generated CISO reports, ISO/SOC2/PCI-DSS/HIPAA

 **All 7 layers are auto-generated from stack metadata — zero manual configuration**

0

Manual security
configs needed

100%

Encryption coverage

Auto

CISO-level
compliance reports

Real-time

CVE & drift
detection

Expanding Rancher's Market

From Kubernetes management to full-stack automation — new customers, new revenue

The Bottom Line

The First Managed Open-Source Platform

Managed Speed

Faster than hyperscaler services

Open Source Power

Latest innovation, no lock-in

Full Sovereignty

Your data, your infra, your rules

Compete head-to-head with AWS, Azure, GCP managed services — without sacrificing control, transparency, or future freedom.
